team

PYXIS (*pik·sis*)

**Carnegie
Mellon
University**

1961

1969

2011

A photograph of the International Space Station (ISS) in orbit above Earth. The station's complex structure, including large solar panel arrays, is visible against the dark blue and white clouds of the planet. The text is overlaid on the center of the image.

ISS Live!, a project that uses real-time data (scheduled activities & “telemetry”) from the International Space Station to educate and captivate a new generation of American youth.

1960s

2011

“[Seeing Apollo] galvanized me to want to be an astronaut... I knew I was going to have to be pretty educated. That's why I really believe in your project: y'all can do that for poor [kids] out there that don't have a vision...”

– Dan, telemetry expert

Team Pyxis

Nisha Kurani
Co-Project Manager

Clifton Lin
Co-Project Manager

Sony Verma
Research Lead

Tony Poor
Design Lead

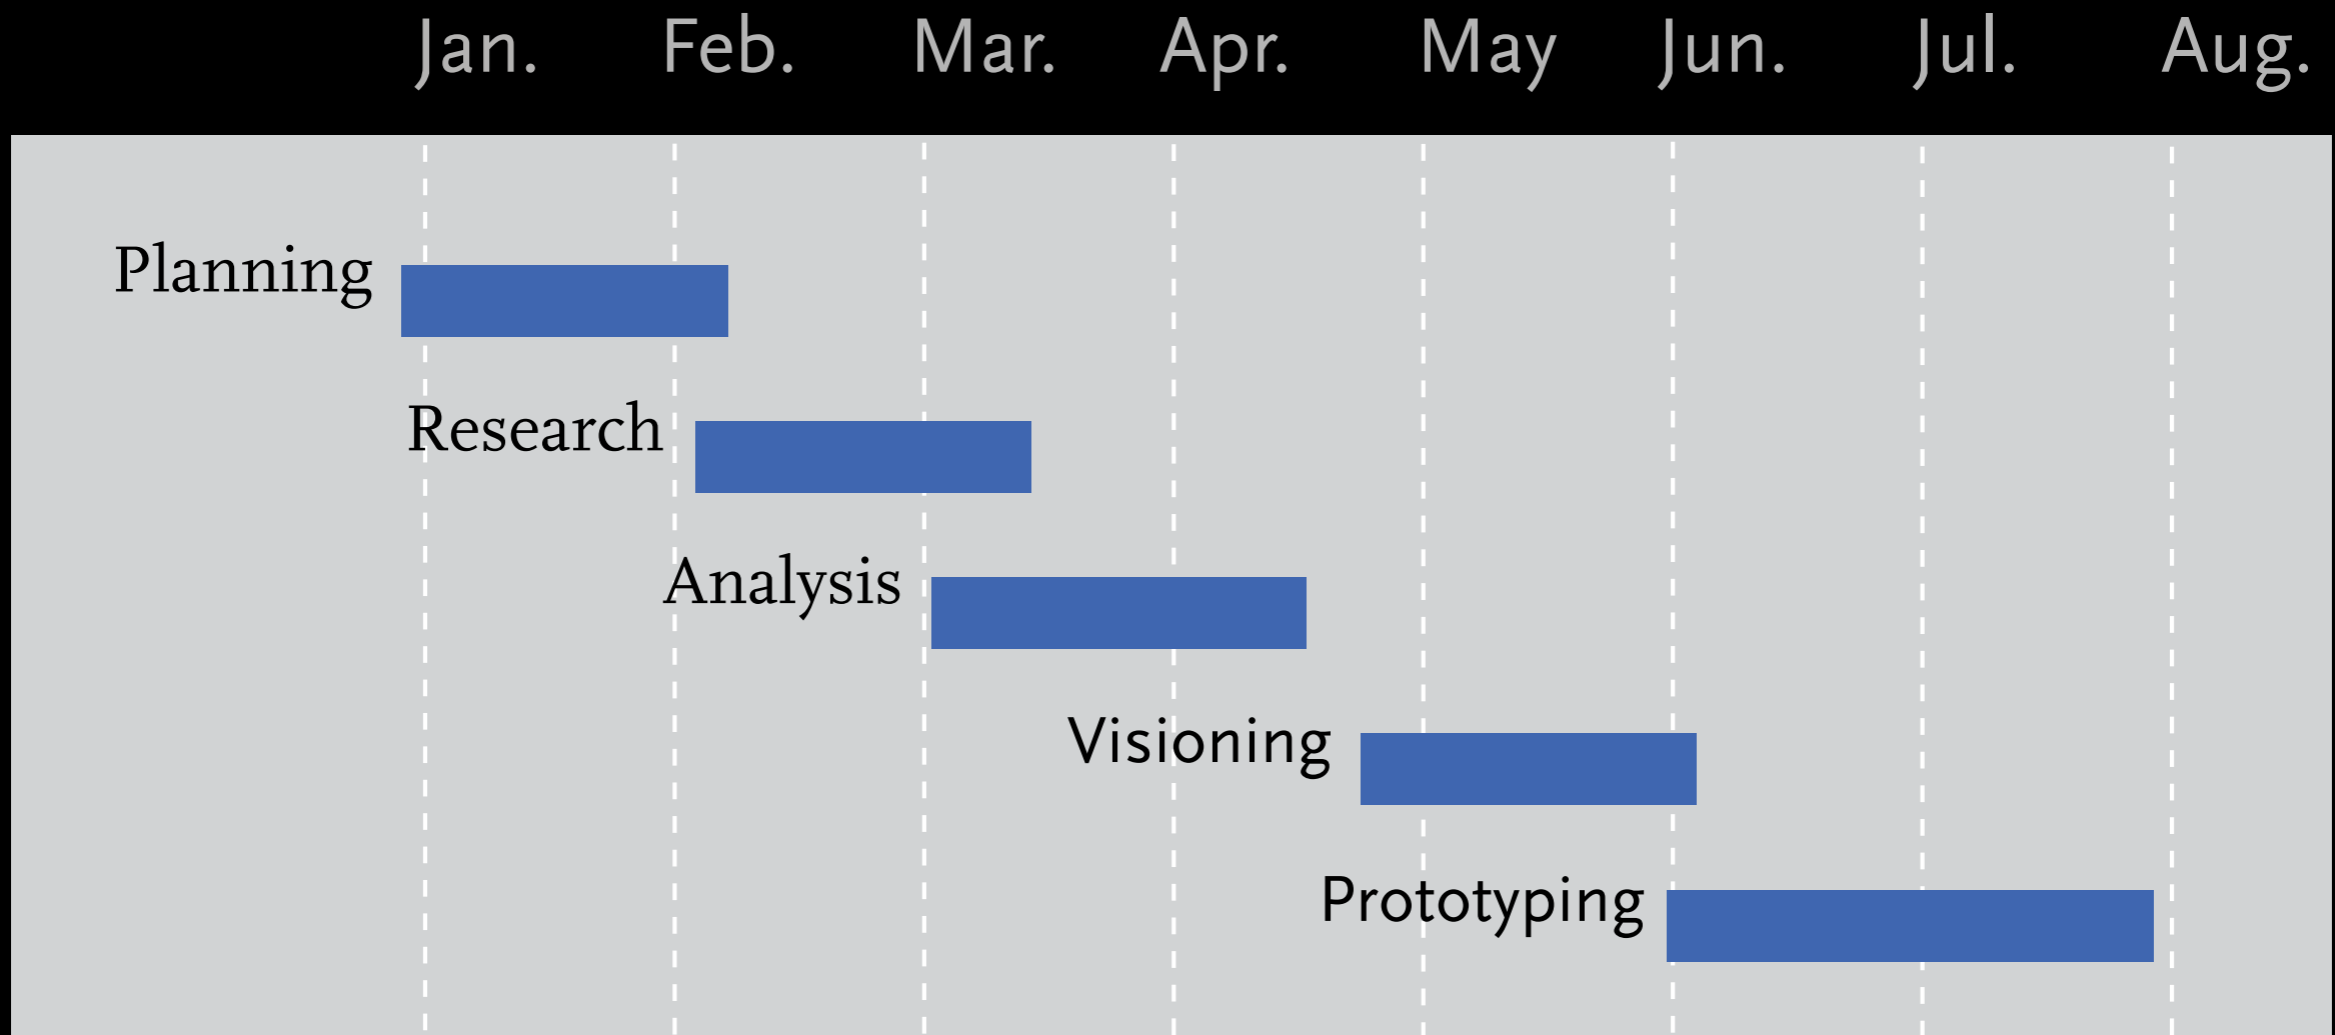

Eric Dudiak
Technical Lead

About the HCII

261-284
Master of
Human Computer
Interaction
Rooms 203-238

Carnegie Mellon's **Human-Computer Interaction Institute** is dedicated to research and education in topics related to technology that supports human activity. The two-semester **capstone project** connects teams of masters students with industry sponsors.

Project Schedule

Spring Process

- 1 Background Research
- 2 Field Research
- 3 Insights
- 4 Visioning
- 5 Next Steps

1

Background Research

Trip to JPL

Met the ISS Live! team to understand the goals and context of the project.

Literature Review

37 articles, talks, and books.

Learning Theories

Connect old and new knowledge, provide realistic situations and social interactions

Engagement Theories

Use social influence, reduce barriers to engagement, use the power of action

Educational Technologies

Promote participatory learning, let user performance speak to effectiveness

Platform-Specific Design

Different mediums have different advantages

Competitive Analysis

PRODUCT	VALUE CRITERIA										Price	User Rating (out of 5.0)
	Usability (Heuristic Evaluation)	Immediate Engagement	Accessibility	Novelty	Data Visualization	Interactivity	Community/Social Interaction	Incentives to Return	User-generated Content			
NASA HD	○	◐	◐	○	○	◐	◐	○	○		Free	3.5
Eyes on the Solar System	●	◐	●	●	●	●	○	○	○		Free	N/A
Star Walk	●	●	◐	●	●	●	○	●	○		\$4.99	4.5
Solar Walk	◐	●	◐	●	●	●	○	○	○		\$2.99	4.0
The Elements	●	●	◐	●	●	◐	○	○	○		\$13.99	4.0

● = high
 ◐ = moderate
 ○ = minimal/none

2

Field Research

Research Demographics

Educators

*How do they craft content/use
tools to communicate?*

NASA

*What are their goals
and objectives?*

Students

*What are their goals,
needs, and desires?
What motivates them?*

Flight Controllers

Contextual Observation: observe the practice of flight controllers using scheduling systems.

Flight Controllers

Contextual Observation: observe the practice of flight controllers using scheduling systems.

Activity Affinity: understand which ISS activities happen most frequently and which are most exciting.

Flight Controllers

Contextual Observation: observe the practice of flight controllers using scheduling systems.

Activity Affinity: understand which ISS activities happen most frequently and which are most exciting.

Interviews: uncover the reasons behind flight controllers' passions for space.

Students

Postcard Drawing Activity: discover what students know about space.

Students

Postcard Drawing Activity: discover what students know about space.

Background Interviews: learn how they use smartphones/schedules, and talk about their interest in space.

Students

Postcard Drawing Activity: discover what students know about space.

Background Interviews: learn how they use smartphones/schedules, and talk about their interest in space.

Card Activities: understand what's interesting to students about space and their daily activities/classes.

Students

Postcard Drawing Activity: discover what students know about space.

Background Interviews: learn how they use smartphones/schedules, and talk about their interest in space.

Card Activities: understand what's interesting to students about space and their daily activities/classes.

Contextual Thinkaloud: uncover how students discover new educational applications and evaluate their usefulness.

Teachers

Classroom Observation & Interview: learn how teachers engage students in the classroom.

Reflection

- Interviewing enthusiasts
- Iteration on research
- Accessing public schools
- Balancing demographics

3

Insights

1
*Captivate Students'
Attention*

2
*Provide a
Visceral Experience*

3
*Relate it to
their World*

4
*Manage
Interruptions*

p-block

- = Gas (at room temperature)
- = Liquid (at room temperature)
- ☒ = Radioactive

Do It Now...

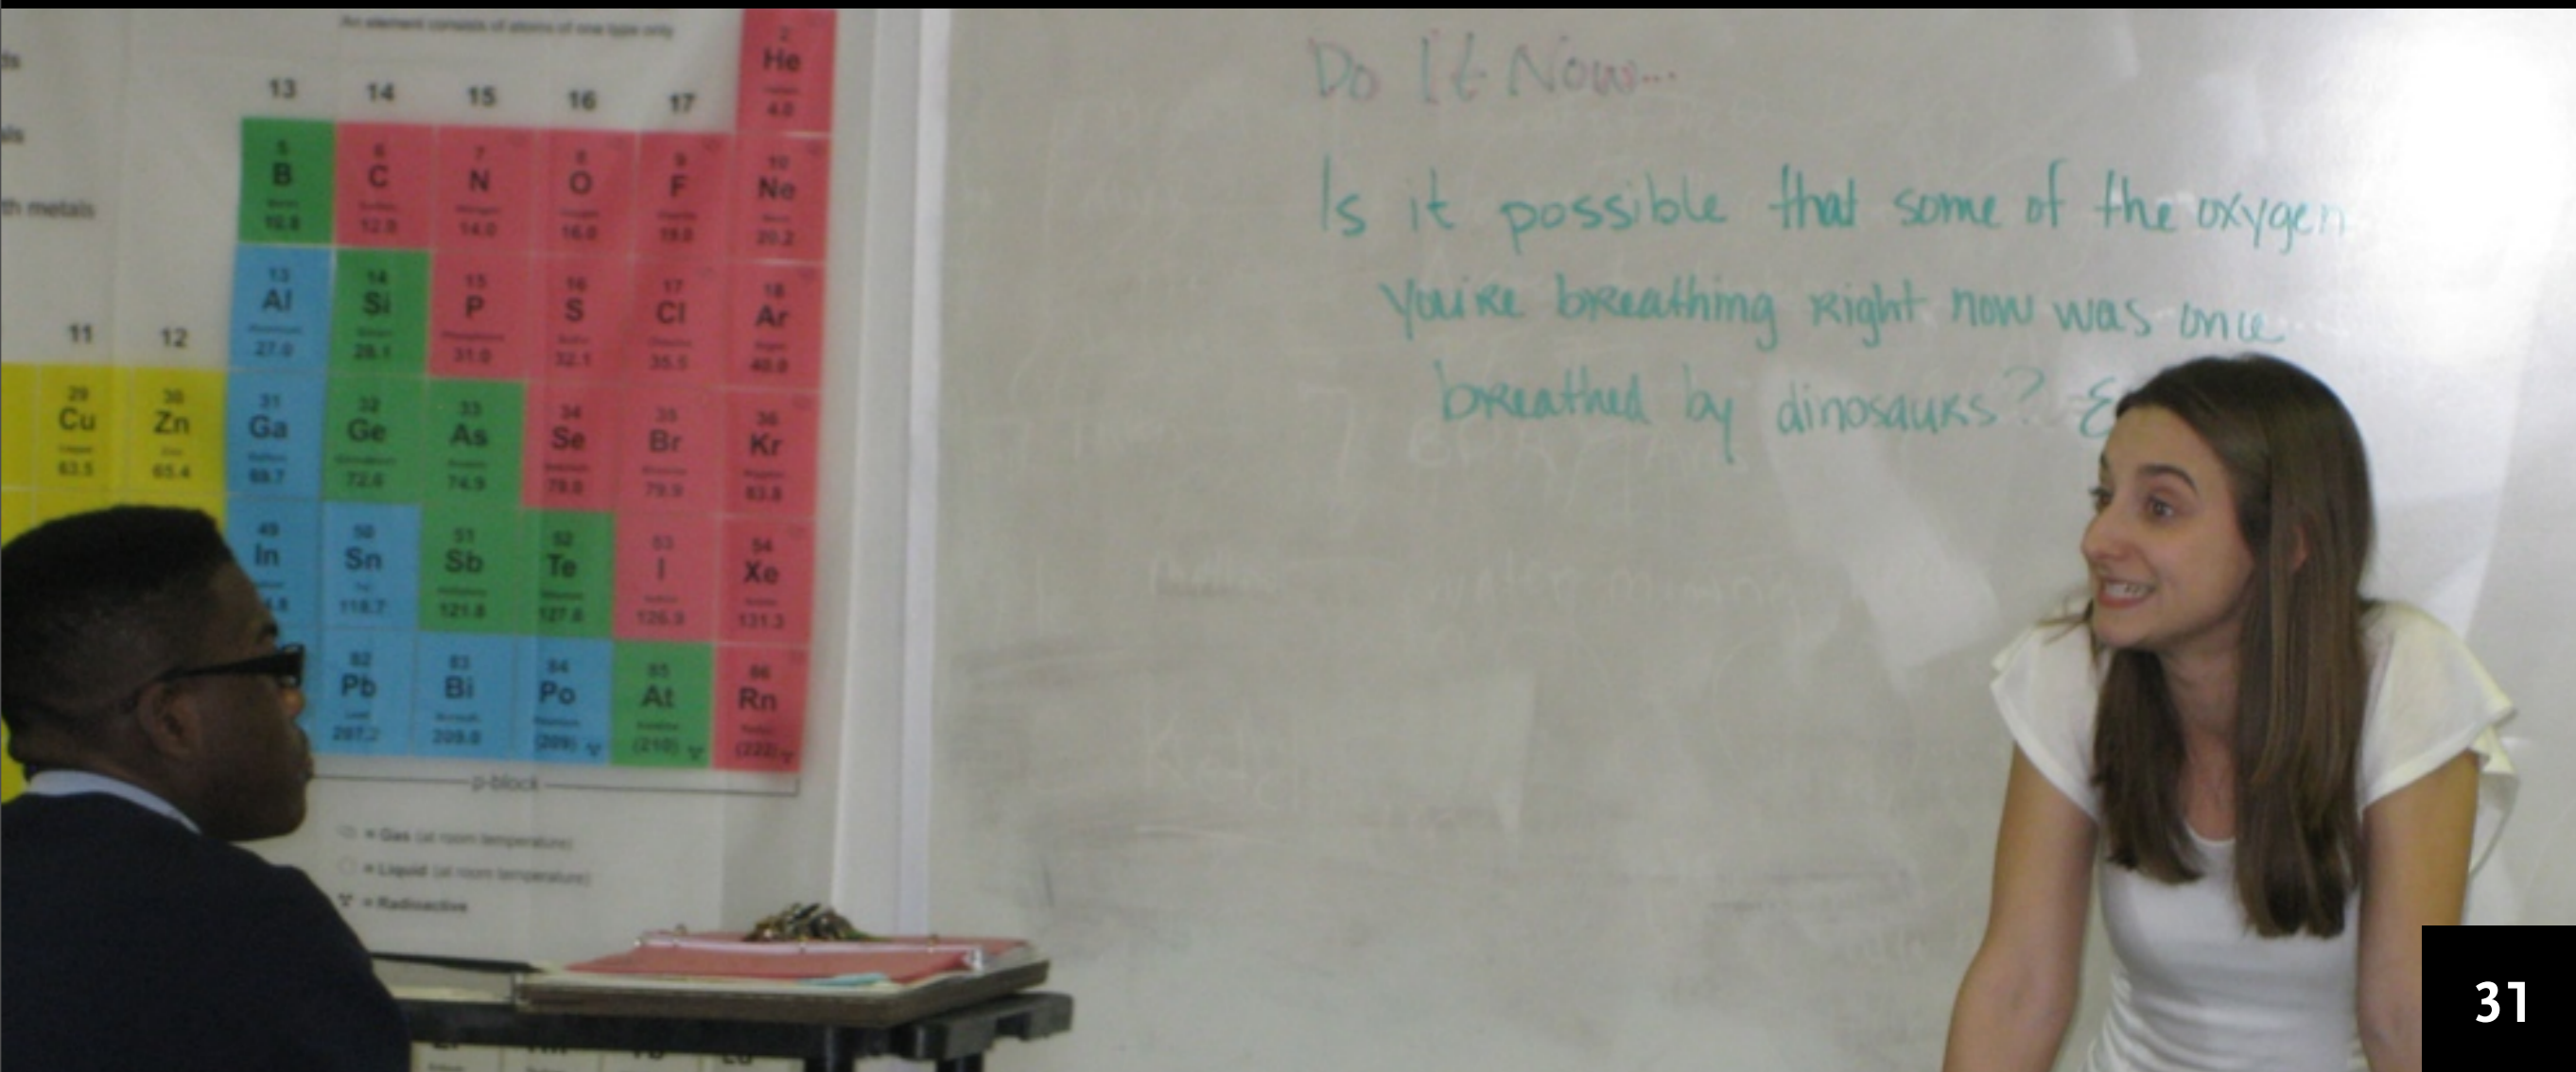

Is it possible that some of the oxygen
you're breathing right now was once
breathed by dinosaurs? $\frac{1}{8}$

Captivate Students' Attention

Curiosity arises from familiar topics with a new twist.

All four teachers introduced new topics with a catchy question, image, or activity that built on what students already knew.

Captivate Students' Attention

Visuals universally attract attention.

All students sought out visuals, commenting that the appearance and layout of websites and applications affected their impression of the content.

1
*Captivate Students'
Attention*

2
*Provide a
Visceral Experience*

3
*Relate it to
their World*

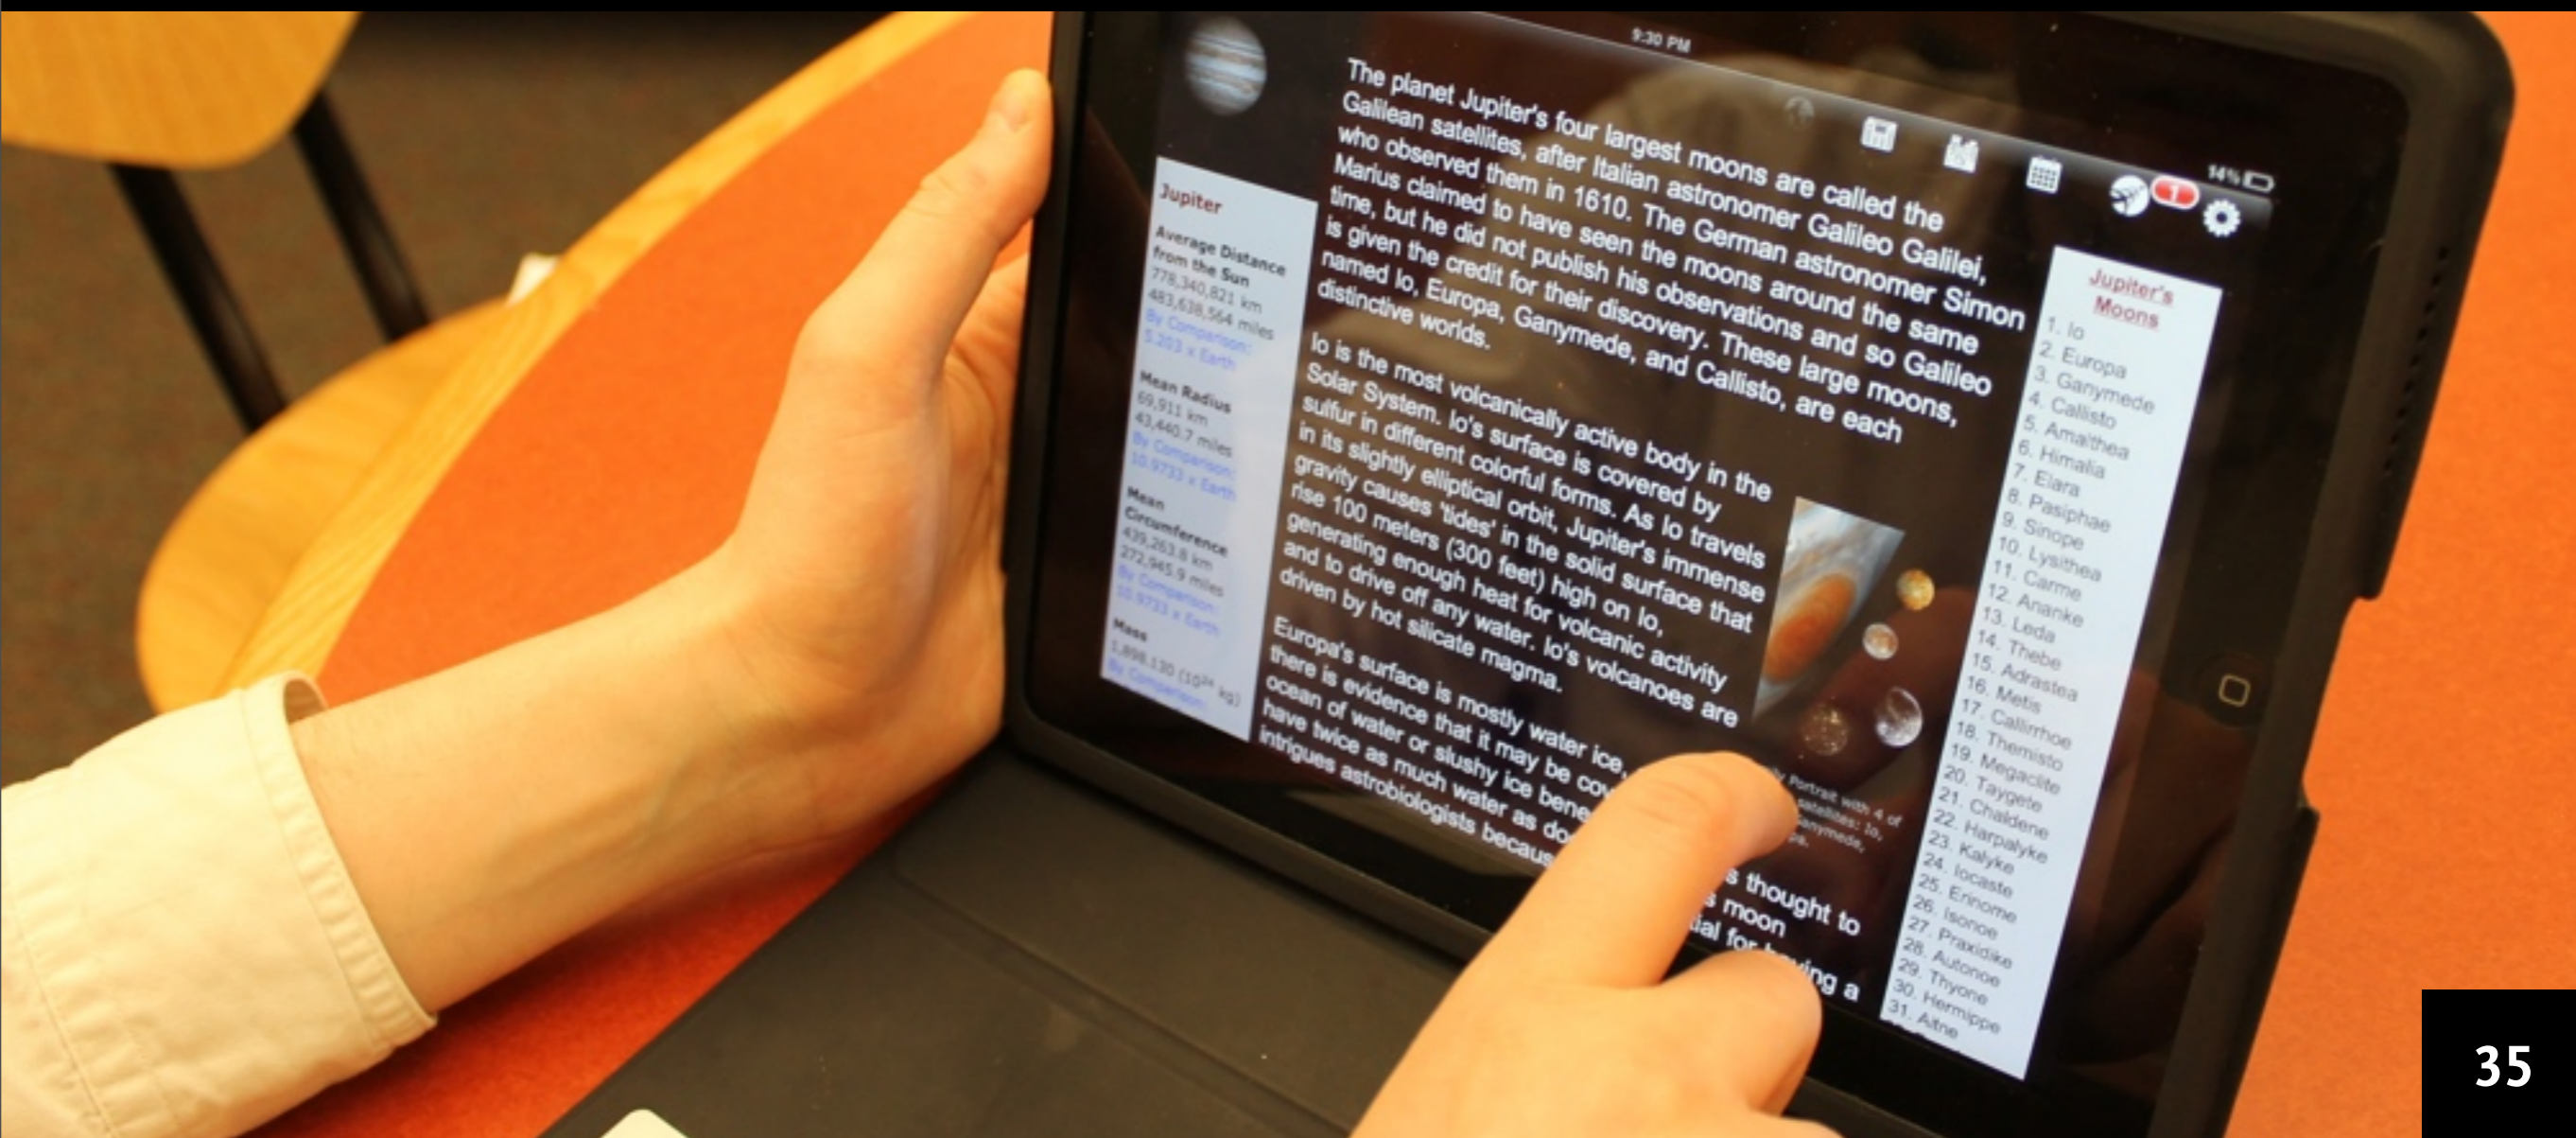

4
*Manage
Interruptions*

Provide a Visceral Experience

Hierarchy of information facilitates browsing.

Students explored information layer by layer, true per the advice of NASA outreach and industry web designers.

Provide a Visceral Experience

***Hands-on presentations of content
were almost universally successful.***

“We all look forward to this class all day... it’s hands-on, not like math, which is a bunch of problems.”

– Alexis, 11th grader

Provide a Visceral Experience

Science experiments onboard the ISS intrigue students and flight controllers.

Card-sorting activities revealed that more than half of students and flight controllers found science experiments on the ISS interesting.

Provide a Visceral Experience

Students want to know how things work and what it's like in space.

*“When people think about space, we think about space walks and stuff...
We don't think about how they exercise or what they do in their free time,
like board games.”*

– Ashwin, 11th grader

Provide a Visceral Experience

Emotion adds excitement and increases memorability.

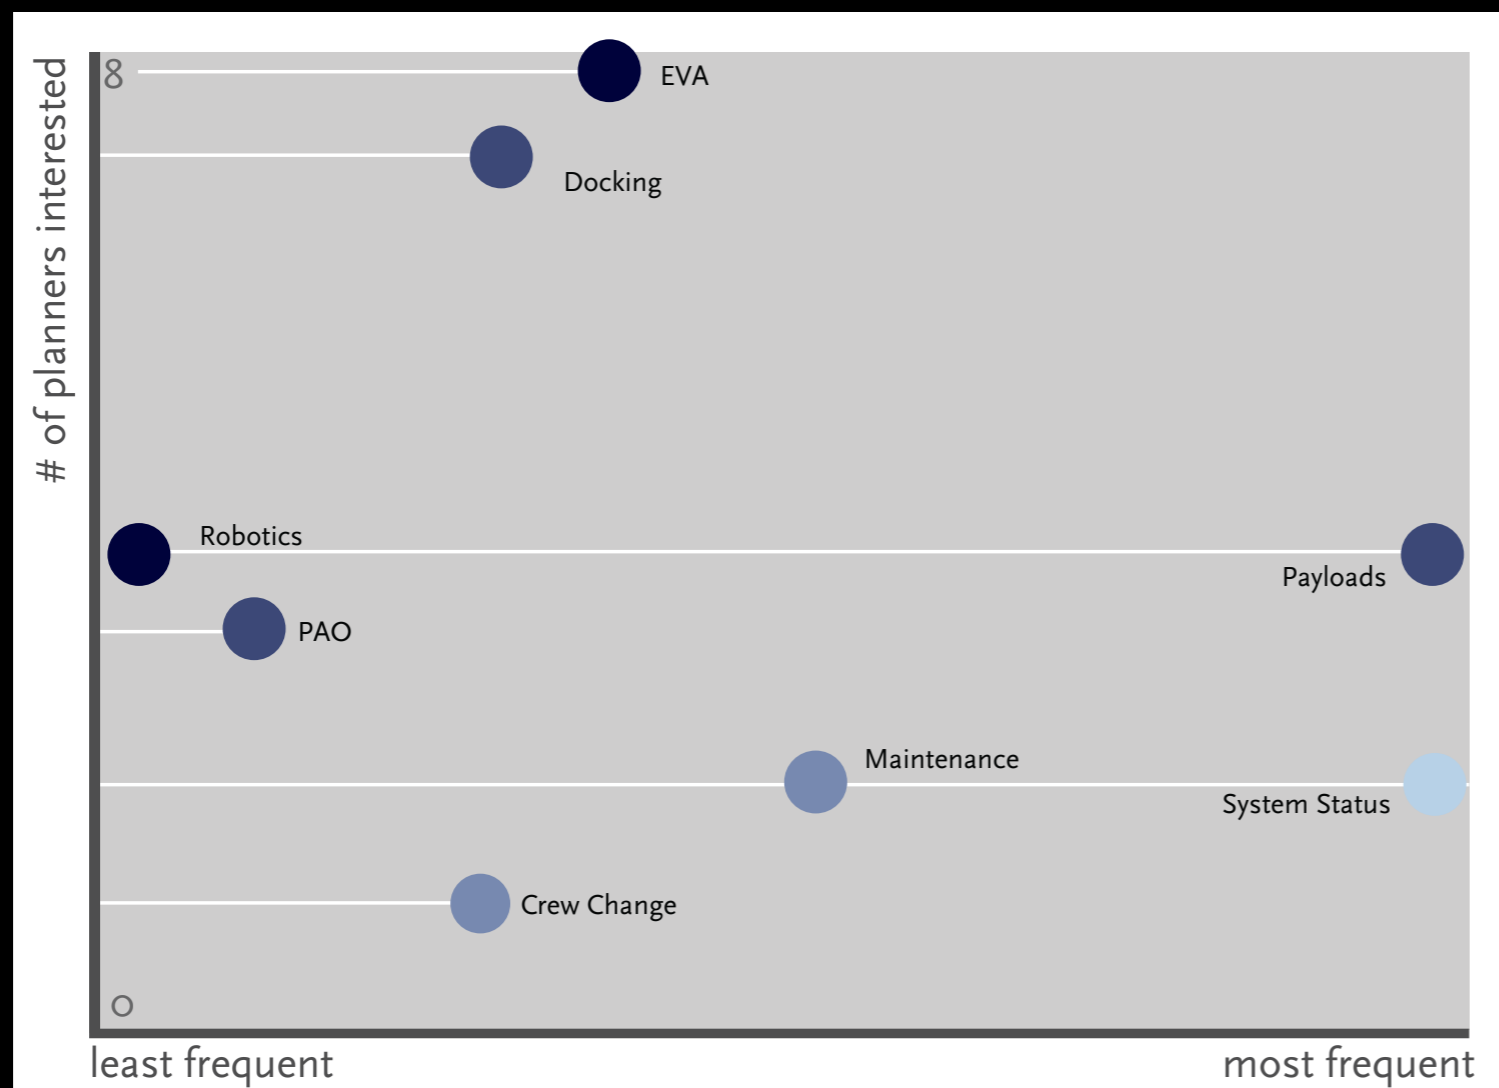

*“We had a major failure of the Russian computing systems on the ISS... we were losing battery power to the Soyuz. If we didn’t have a solution in eight hours, we’d have to abandon the space station.”
– James, flight controller*

Provide a Visceral Experience

High-risk and critical activities are most interesting.

Of all activities, EVA and docking missions garnered the most interest from both flight controllers and students.

1
*Captivate Students'
Attention*

2
*Provide a
Visceral Experience*

3
*Relate It to
Their World*

4
*Manage
Interruptions*

Relate It to Their World

Familiarity facilitates interest.

“So you could look at amino acids from biology and you could even go deeper in chemistry and look at the different chemicals and whatever that compose it, and then you can go even deeper in physics and talk about what kind of bonds there are and what are the forces acting on the molecules and everything is really connected.”

– Isaac, 12th grader

Food at you
Own Risk...

Oxygen
Carbon
Hydrogen
Nitrogen

Relate It to Their World

Students want to see the value in what they are learning.

“[Theory class] also can seem kind of pointless, like in the end you're kind of just arguing of meaningless stuff, and it doesn't really matter, so it is like a good thing to take with you, but it's not really like useful.”

– Daniel, 11th grader

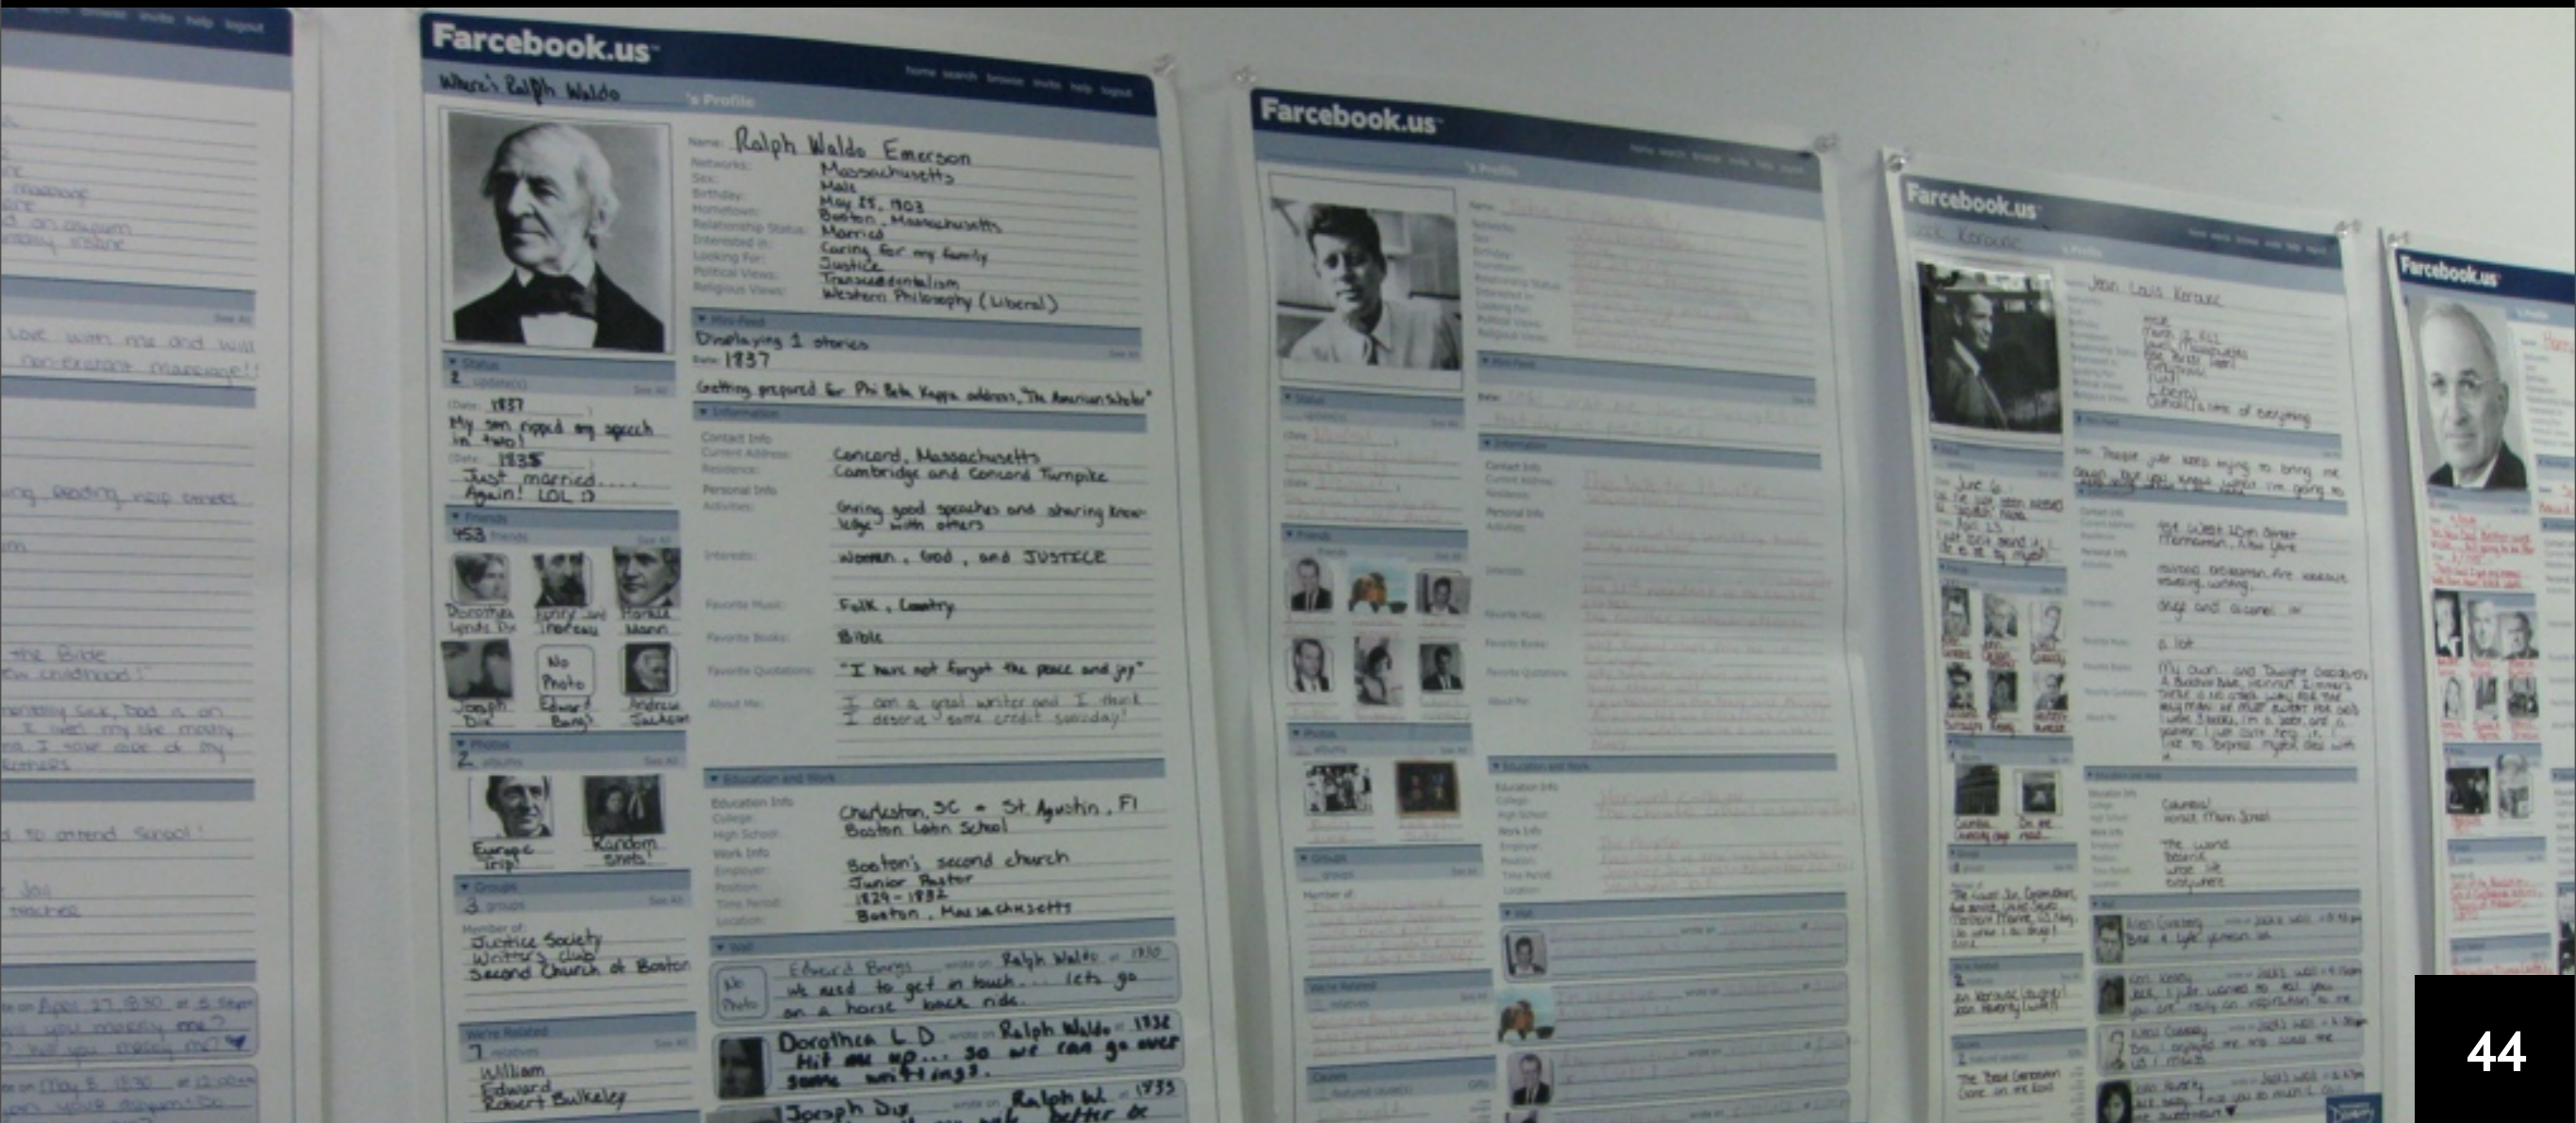

Relate It to Their World

Different perspectives enrich the story.

“Because it’s US History and I’m from Germany. I can see all the history, like WWII, from a different perspective.”

– Till, 10th grader

Relate It to Their World

Camaraderie resonates with students and flight controllers.

*“I think it’s cool that [nations] can look past politics to work together.”
– Bryanna, 10th grader*

1
*Captivate Students'
Attention*

2
*Provide a
Visceral Experience*

3
*Relate it to
their World*

4
*Manage
Interruptions*

Manage Interruptions

Adapting to the environment reduces impact of disruption.

Mobile design takes into account context of use, short attention span, and is designed for interruptibility.

Manage Interruptions

Immediate engagement keeps users interested.

When load times exceeded expected wait times, students preferred to move on to other tasks.

Manage Interruptions

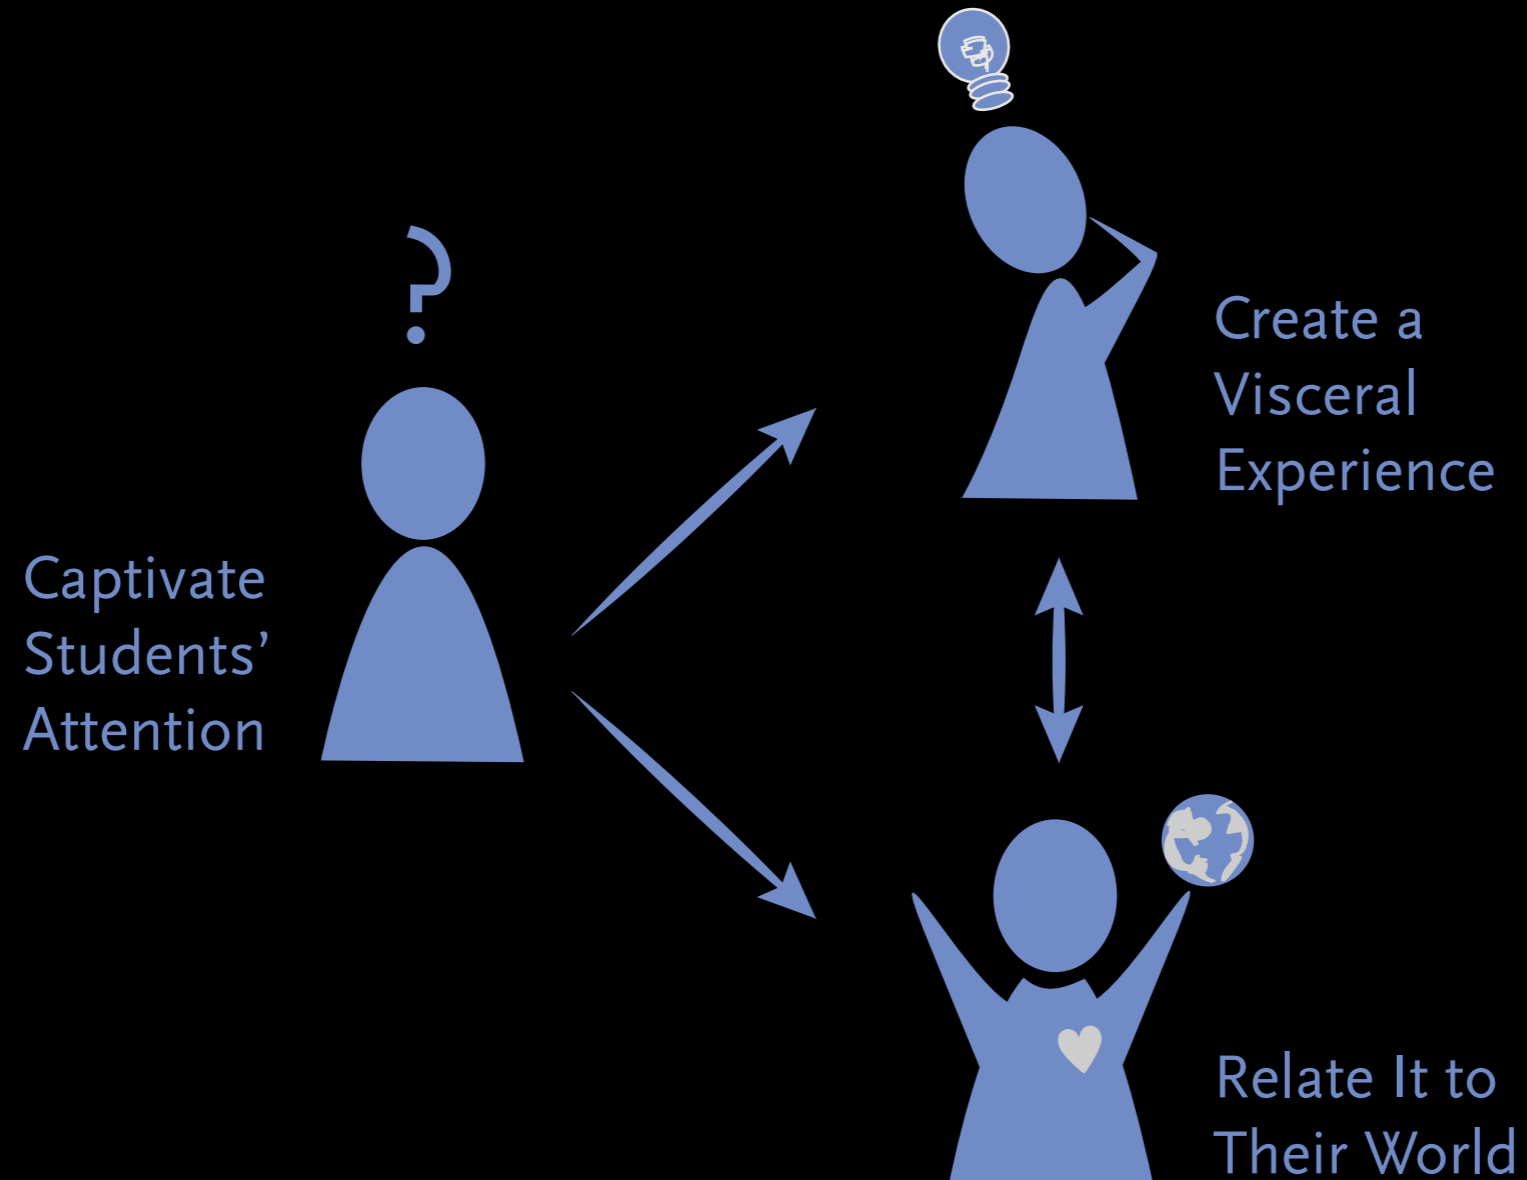

Users in control of their experience are more likely to stay engaged.

Agency increases user's interest in participation.

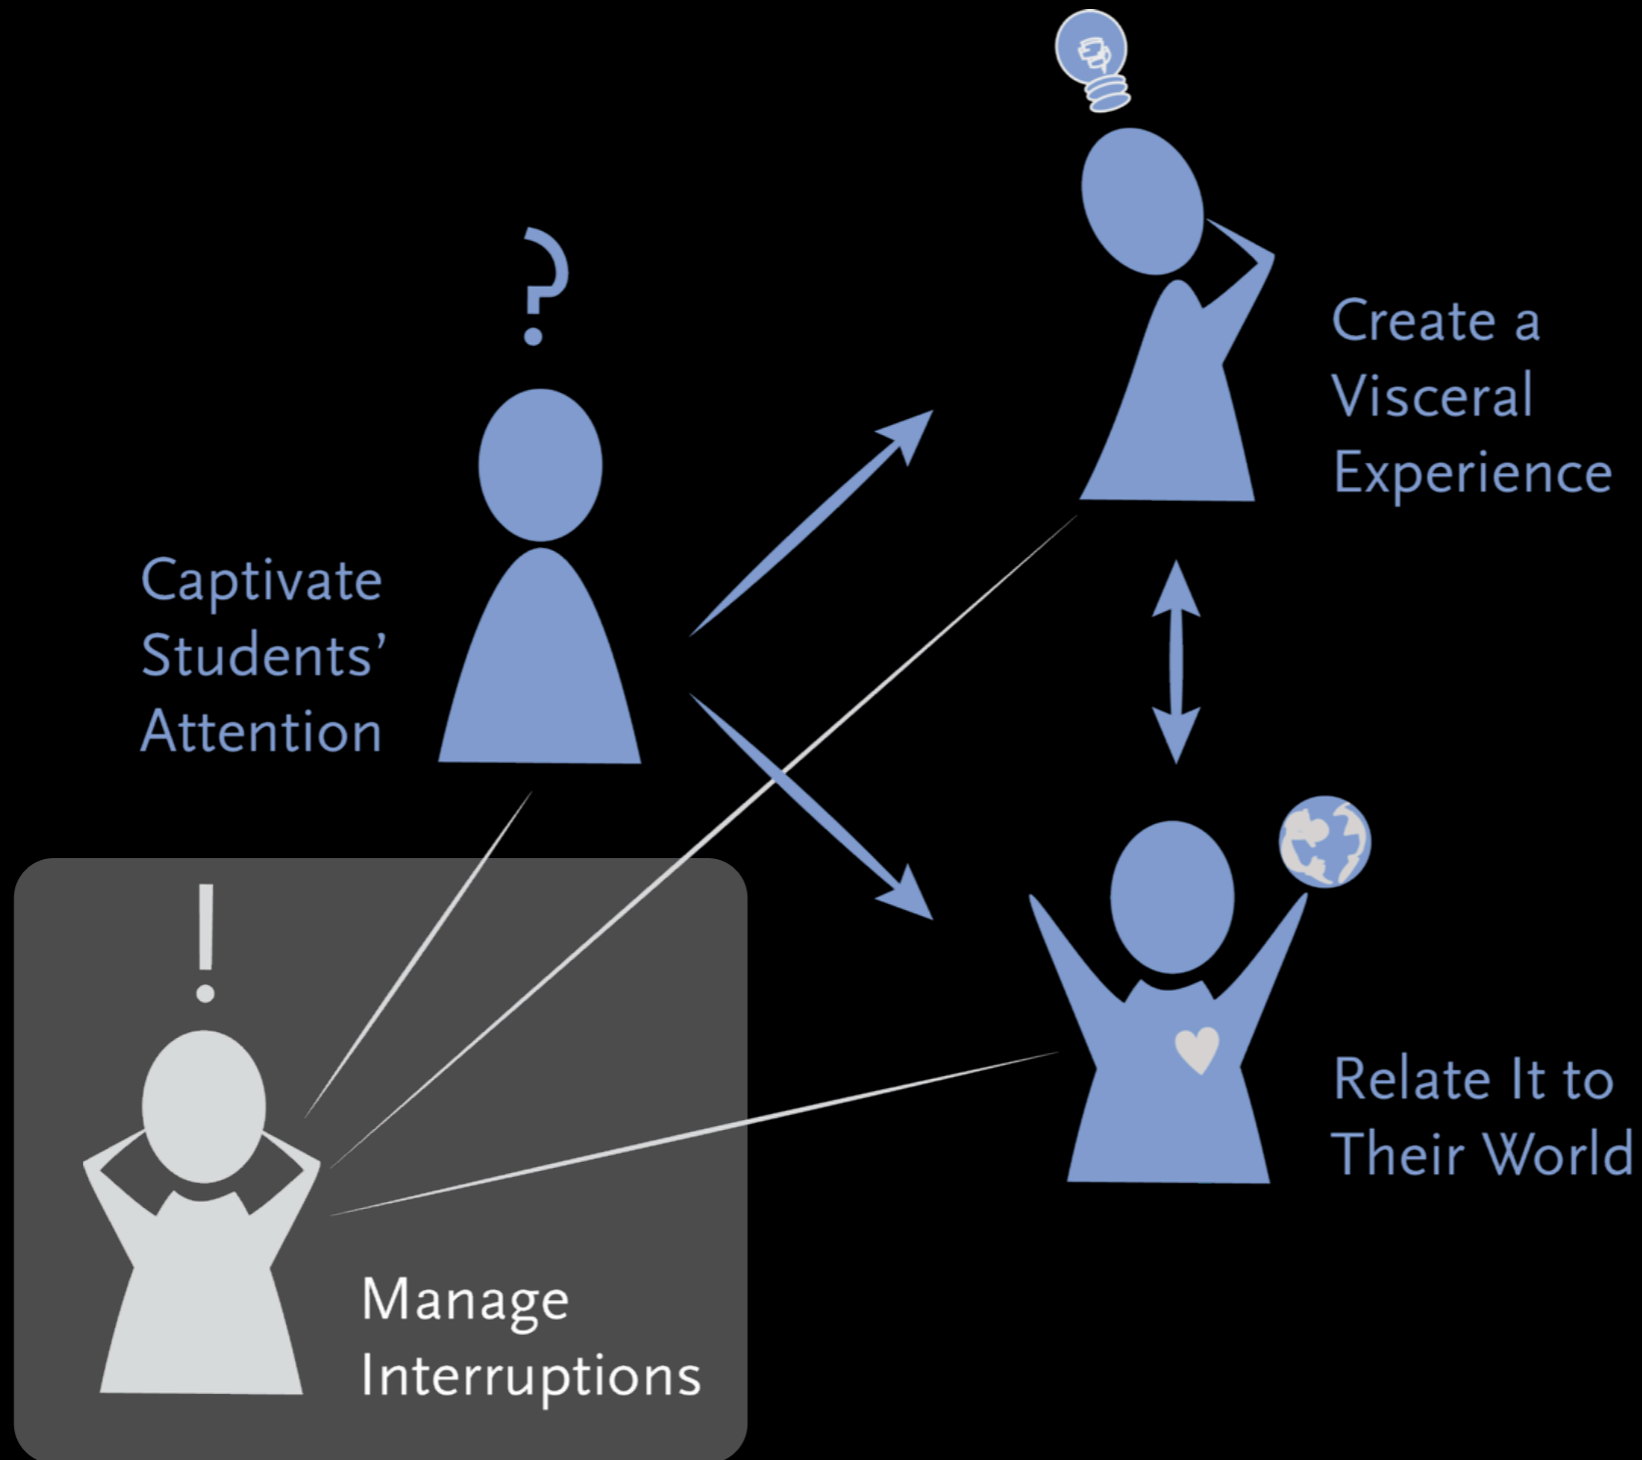

Insight Relationship

Insight Relationship

4

Vision

Personas

Mapped research participants to three different archetypical students:

Faith Hudson (primary)

Steve Brown (secondary)

Taylor Jordan (secondary)

A series of vertical strips of sticky notes, each representing a student's profile:

- ASHWIN** (green strip): Likes free Apps; Don't like Smart phone, iPad; Hangs out w/ friends, play video games, watch movies, play music; Dad's influence → likes math; Calc makes more sense than any other class so far; CS.
- NIMI** (orange strip): cool to program on phone; ISS → in space → sleep on walls; Reads reviews for Apps to see if worth it; Checks "Whats Hot" in App store; Plays rick rock.
- ALEXIS** (yellow strip): wants to start her own business so she can work a - home; looks forward to chemistry because it's hands-on; loves to tutor young students (learns from them!); plays games at Boys & Girls club (scrabble, Apples to Apples); likes learning something new.
- TYSON** (purple strip): Space observation is a hobby & fun activity; Joining the NAVY after high school; Has a telescope at home.
- ASHLEY** (yellow strip): Really passionate about chemistry; Did science competitions in high school; Liked NASA in; Didn't know much about space.

A series of vertical strips of sticky notes, each representing a student's profile:

- RYAN** (yellow strip): likes chemistry because it's easy to understand & teacher is nice; doesn't know much about NASA but knows a little about space (planets); seems excited & interested in space though he only knows basics.
- SUN** (purple strip): appreciates geometry; design major; likes group work.
- BRYANNA** (orange strip): likes chemistry; likes to learn things.
- DERRICK** (purple strip): likes to learn things; likes to learn things.
- KIERRA** (light blue strip): likes to learn things; likes to learn things.

Faith Hudson

“Dad keeps bugging me to figure out what I want to study in college. I have no idea though. It’s really stressful...”

High-school junior: applying to colleges soon, but doesn’t know what she wants to do.

Stopped learning about space in elementary school, but gets excited by it.

Loves chemistry (hands-on) and playing games/tutoring little kids at the Boys & Girls Club (she learns from them).

Steve Brown

“Space is just really cool: black holes, antimatter, the existence of aliens and stuff... there’s so many unanswered questions out there, so many more things for us to discover.”

College freshman: electrical engineering and physics.

Went to space camp and has loved space since; enjoys deep questions about the universe.

Plays video games and basketball, and is joining the astronomy club.

Taylor Jordan

“Math is terrible; no matter how much I study, I still get bad grades. I like biology, though... I’m actually doing pretty well in it.”

High school sophomore.

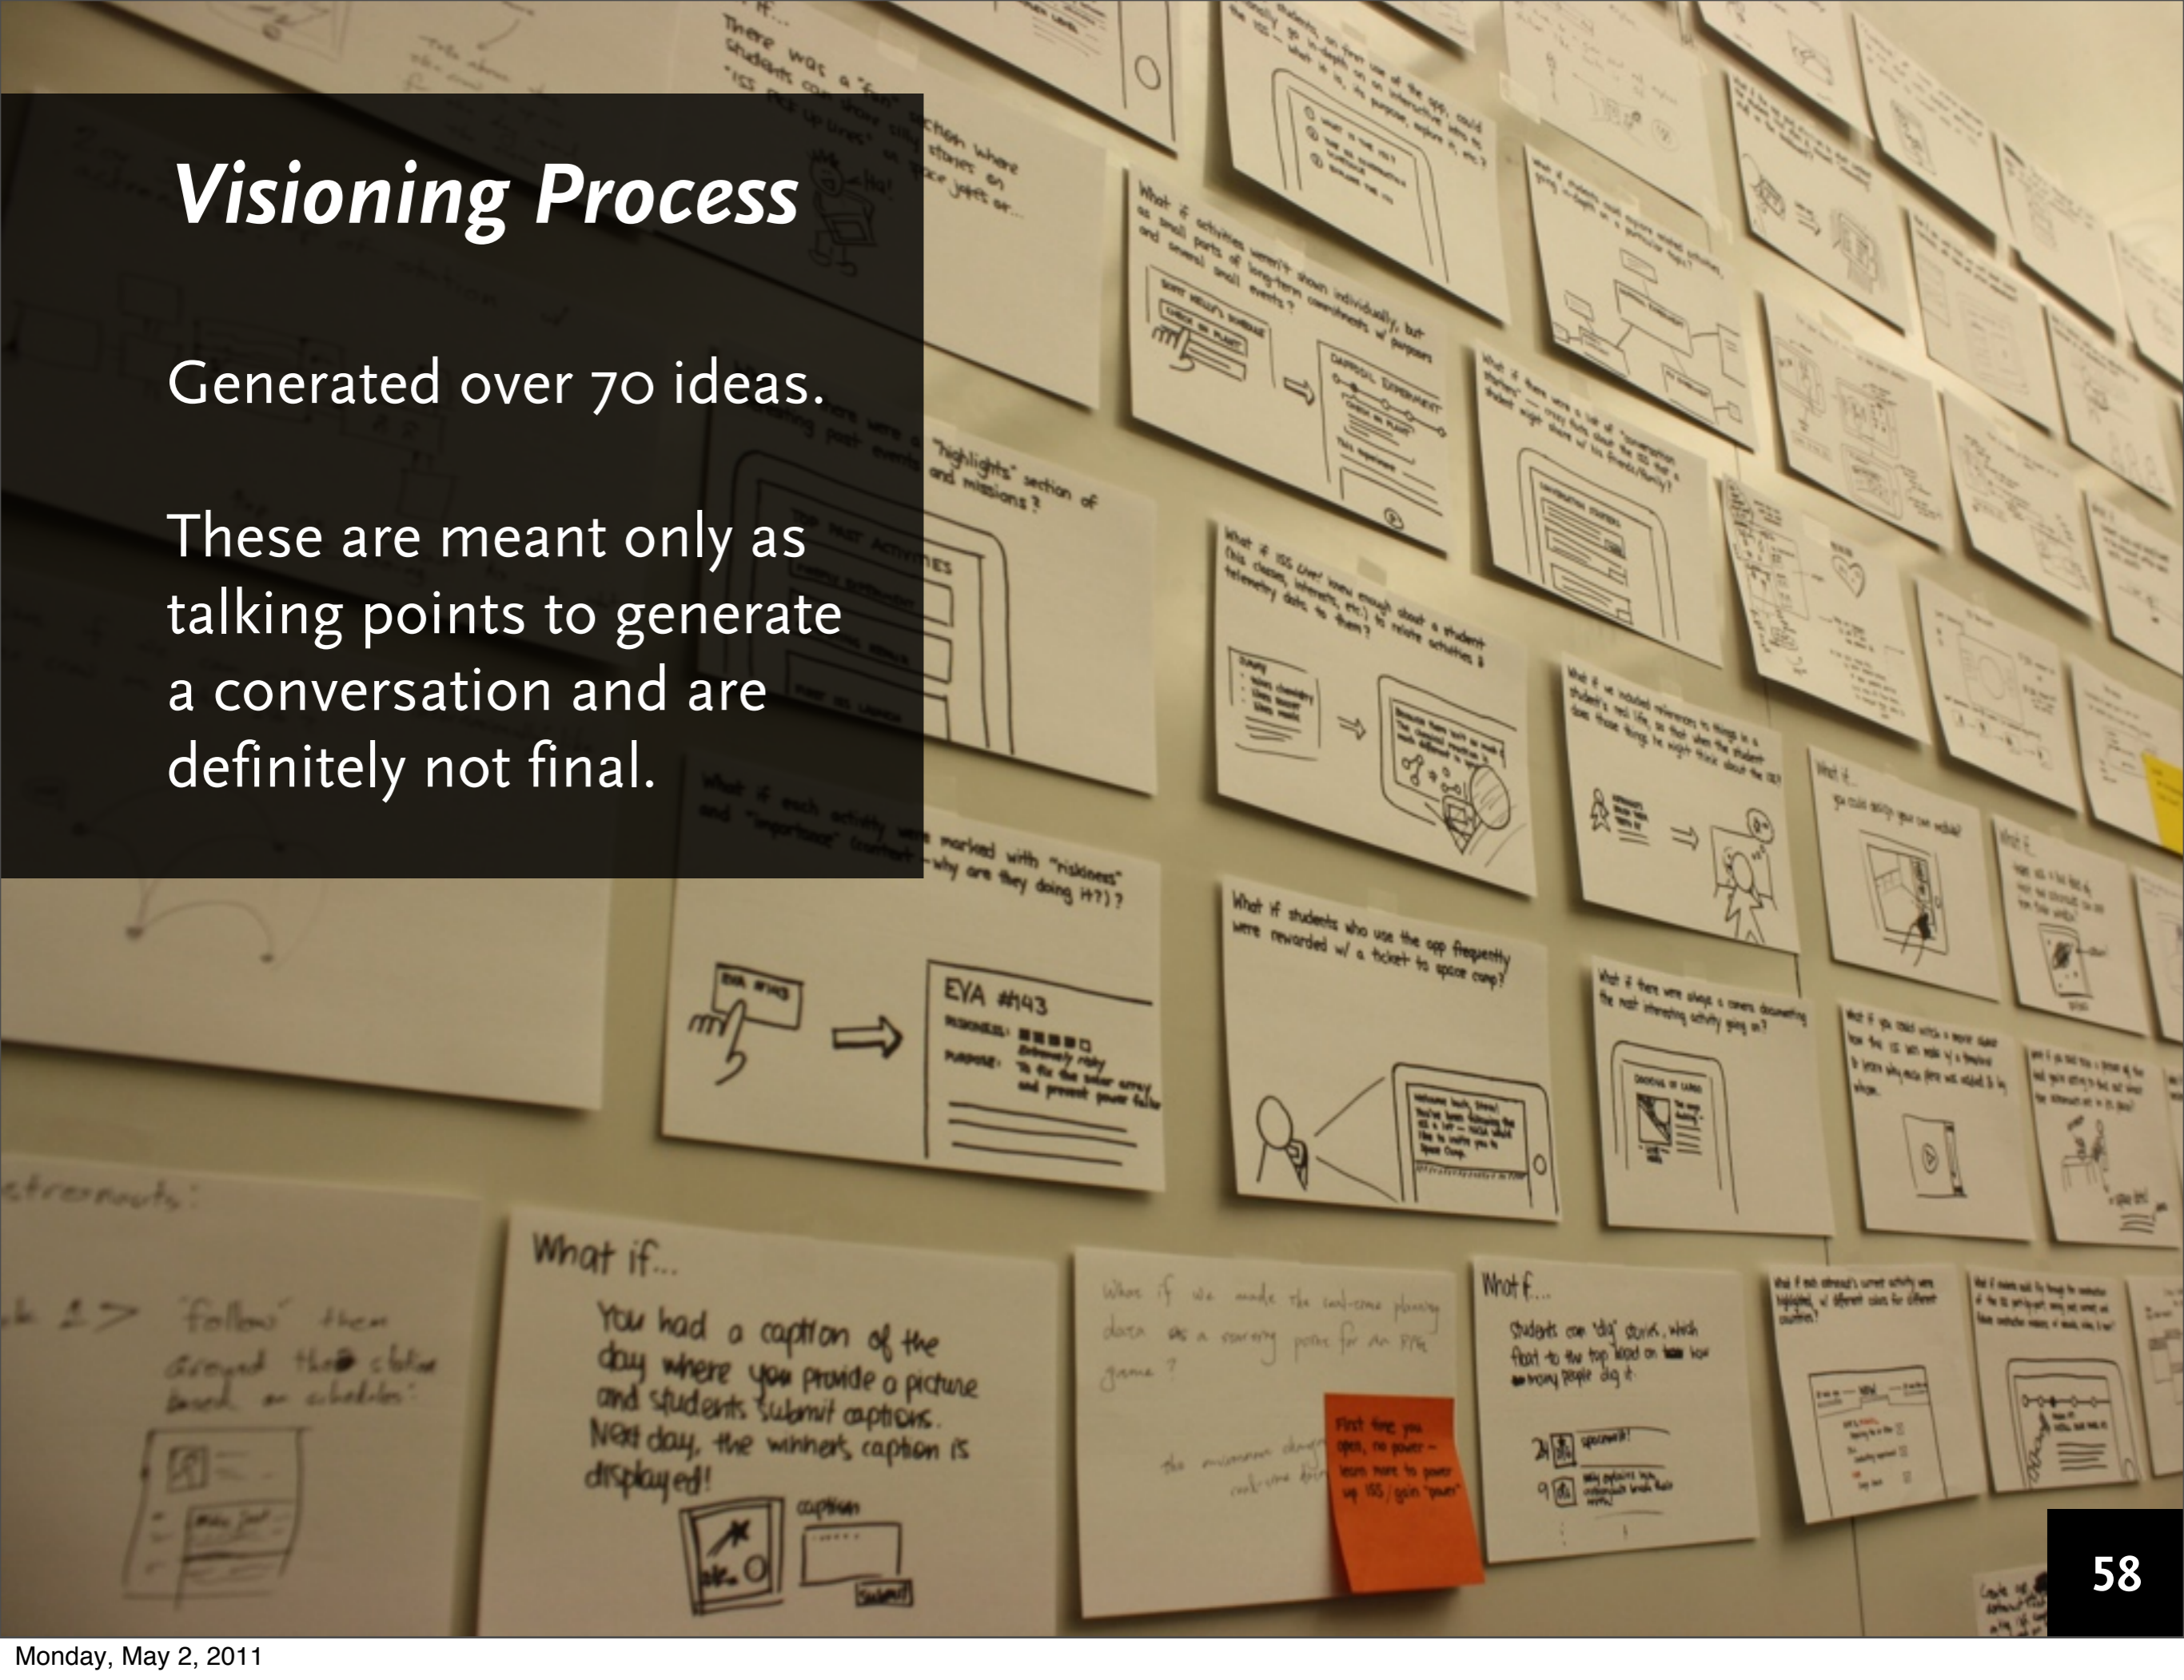

Loves soccer because of her teammates and friends.

Not really interested in space, and really hates math; never got good at it or gained any confidence with it. Unlike other sciences, loves biology (doesn’t involve math and she’s pretty good at it).

Visioning Process

Generated over 70 ideas.

These are meant only as talking points to generate a conversation and are definitely not final.

What if...
You had a caption of the day where you provide a picture and students submit captions. Next day, the winner's caption is displayed!

What if we made the end-of-the-day planning data as a currency piece for an RPG game?

First time you open, no power - learn more to power up ISS / gain "power"

What if...
Students can 'dig' stories, which float to the top based on how many people dig it.

What if each student's current activity were highlighted w/ different colors for different countries?

What if...

...scheduled ISS activities were shown in a personalized, dynamic, and educational way?

Personalization can tailor the application to each student, bringing the parts they are more interested in to the forefront.

Dynamic, educational content that parallels school work can build on the material students already know.

What if...

...we could use a virtual, hands-on approach that borrowed from augmented reality or gaming?

Augmented reality could allow students to browse data in a more immersive way while connecting ISS work to their world.

Games can reinforce learning while making an application more interesting and help drive repeat usage.

What if...

...we can enhance the collaboration amongst peers to fulfill a shared learning experience?

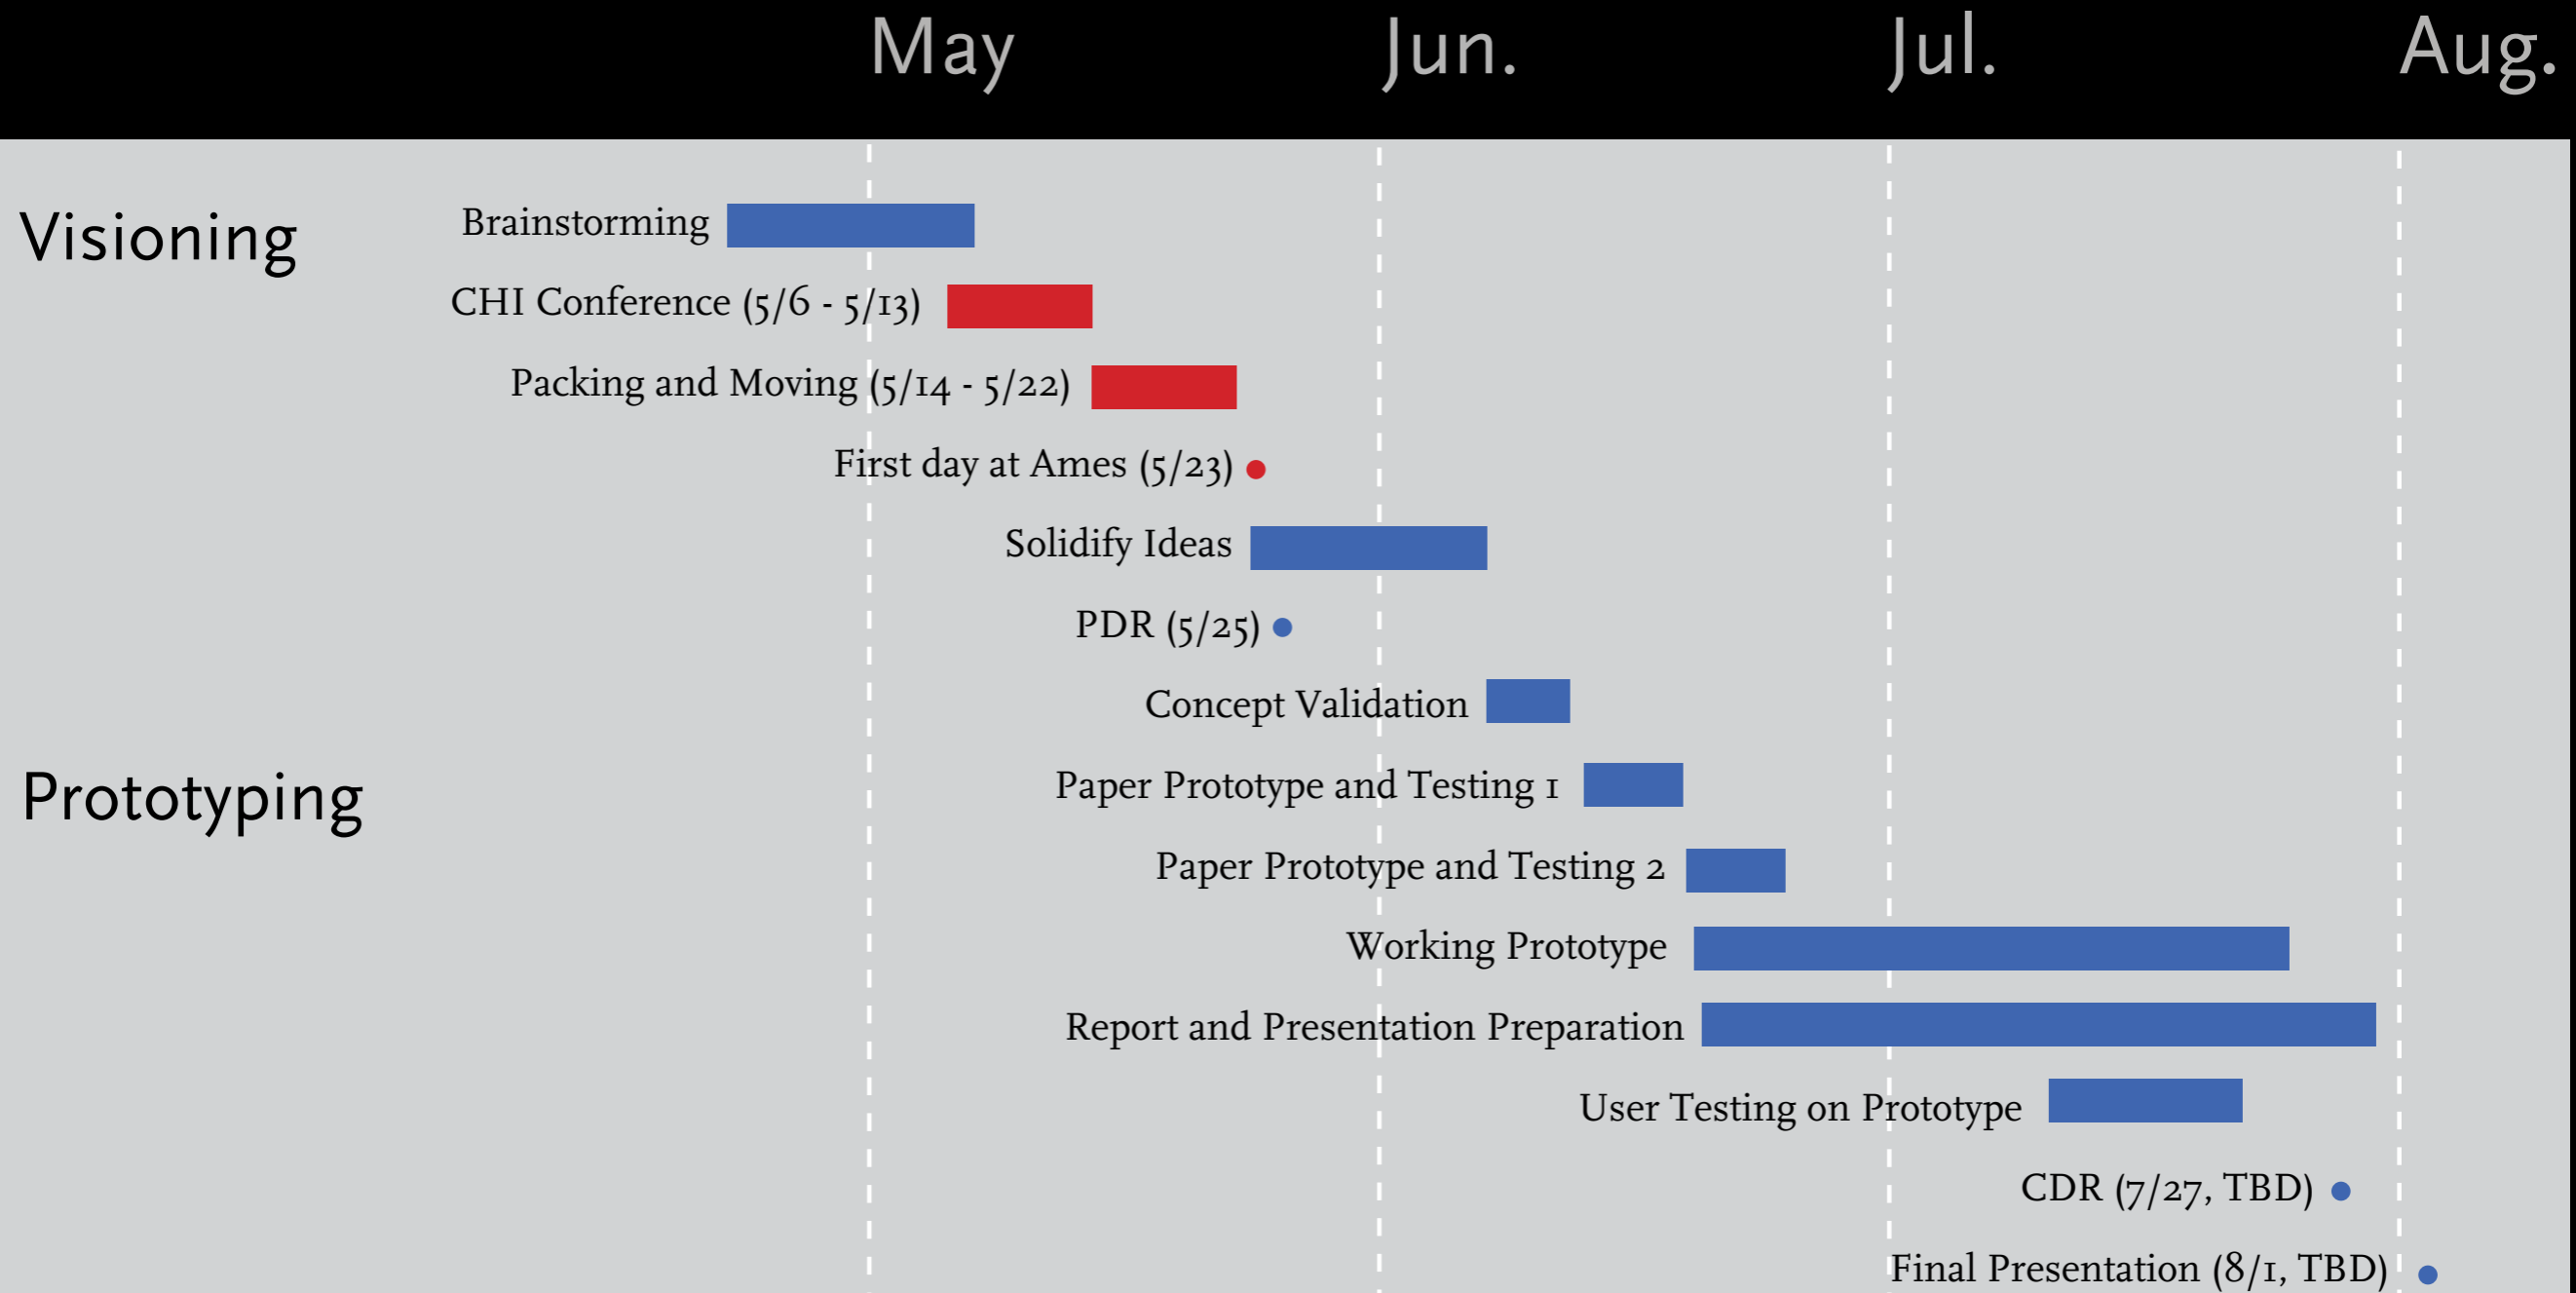

Collaboration allows students to work together, giving them a greater sense of purpose and encouraging prolonged usage.

Contribution back to NASA might help students feel involved while helping the application directly meet their expectations.
